

EPR Overview for Thailand

Thailand is in the early stages of developing EPR schemes, but the country has made commitments to improve waste management and circular economy practices.

Mattresses: No formal EPR scheme exists for mattresses yet, but the government is exploring circular economy models, and some companies are voluntarily implementing recycling programs.

Furniture: Thailand does not have an EPR system for furniture, though there is growing awareness of the need for sustainable waste management in the sector. Voluntary initiatives are beginning to appear.

Electric Appliances: Thailand is aligning with global standards under the WEEE Directive, with increasing efforts to manage e-waste through proper channels. The Pollution Control Department (PCD) is working on policies to make producers responsible for the recycling and disposal of electronic goods.
